

Reference Story ASAP Group

Together towards the goal!

In search of security

The ASAP Group places great importance on quality, which is based on a passion for technologically advanced products. In fostering a work-place culture centered around employee appreciation, trust, and open communication, it's crucial to streamline access permissions and time recording processes for all staff members to maintain product quality.

To achieve this goal, Interflex is collaborating with ASAP to develop a suitable solution.

Intensive consultation shapes a solution

A solution is being sought that provides both access control and integration with a project time management program. ASAP handles access control and time recording through a complex and labor-intensive process, especially given the intricate interplay between these components.

To streamline operations, Interflex will introduce an efficient electronic solution, providing ASAP with a comprehensive security technology package including barriers and door conversions.

An essential aspect involves creating a pre-calculator (SAP) for seamless integration with project time management software. Additionally, access control will be available in both online and offline modes, ensuring flexibility without compromising security.

A complete package with many benefits

Initially, access control was implemented using the Interflex software IF-6040. This business software solution not only includes access control and granting of access permissions, but also serves as a pre-calculator (SAP) through integration with the project time management program of the ASAP Group.

Industry:
Development partner
to the automotive industry

Company size:
Approximately 1,500 employees

Solution:
Time recording, access control
(software and hardware)

What the customer says:
“With Interflex as a strong partner, we were able to consolidate existing resources and now benefit from functional processes on all levels.”

Sven Nosse
Head of IT / Information Security Officer

The integration of existing components is another building block in the implementation of a new access system. Interflex offers its customers “everything from a single source.” For ASAP, this also means carrying out mechanical work and collaborating with partner companies.

The barrier systems are operated in successful cooperation with the company Perimeter. The transition of doors to accommodate the mechanical locking systems with TEGAS proceeds smoothly. In collaboration with its partners, Interflex spearheads the implementation of the new system solution for ASAP, ensuring minimal disruption.
